EXPERIMENT

Title

SPECIAL STRING

Description

Alice has a string A consisting of lowercase English letters. Her friend gives her another string S and asks her to modify string A and replace its characters with the characters present in string S.

But, to achieve the above task, Alice must follow the below steps:

- 1. Choose a character from string S that has the minimum ASCII distance from the ith character in string A

Replace the ith character in string A with the chosen character in string S

Your task is to find and return an integer value, representing minimum total ASCII distance that is required to modify string A to the characters in string S. Return 0, if all the characters in string S are already present in string A

Sample Input:

abcd

xyz

Sample Output:

86

Source Code:

```
def min_ascii_distance(A, S):
    total_distance = 0
    for char_A in A:
        min_distance = float('inf')
        for char_S in S:

            distance = abs(ord(char_A) - ord(char_S))

            min_distance = min(min_distance, distance)

    return total_distance

A = input( )
S = input( )

print(min_ascii_distance(A, S))
```
